

Scheme A (core targets after removing misattributed SEA records). Panel A: STRING v12.0 (score ≥ 0.4), 1,037 edges; inner ring = six hubs; labels for the six hubs and the 18 other nodes of highest degree (ties broken alphabetically). Six core targets have no STRING edge (≥ 0.4) to the other core targets and are not drawn: CA5B, CHRNA7, IP6K2, IPMK, NEK6, VDR (the original STRING query had resolved VDR to CYP27B1, which was removed). B: top 10 per algorithm, cytoHubba definitions re-implemented in networkx (rank colour red → yellow); EPC not recomputed. C: genes shared by the five lists.
