Top-ranked Vina pose (grey: protein; sticks: ligand and residues within 4 Å). Scores indicate structural plausibility, not affinity, and are not comparable across receptors. Co-crystal re-dock RMSD (code in parentheses) is the receptor's co-crystal ligand, not the query metabolite; for 3AZ3 it is DS6, so the LCA pose is a cross-dock, not a re-dock.
The pair whose SEA R0 record failed the InChIKey check (E74) is excluded (reported in Table S-docking-excluded and in the heat map of Fig. 5b); the two pairs that failed co-crystal re-docking are in FigS_docking_failed_redock.
