

Scheme A: 762 nodes, 2,294 edges (328 metabolite–target edges after removing 73 misattributed SEA records). Taxa = gutMGene human-subset gut microbes (mixed ranks; not audited). KEGG = all 145 terms DAVID returned for the 134 core targets (114 BH<0.05). Metabolite–target = SEA R0 (known ChEMBL ligand match; potency and concentration not filtered). Labels: top-degree nodes, thinned so that labels are spaced within each layer.
